

Trends in Emergency Department Visits for Intentional Injury at Virginia Commonwealth University Medical Center, Ages 10 - 24 Years, 2003-2019

Background

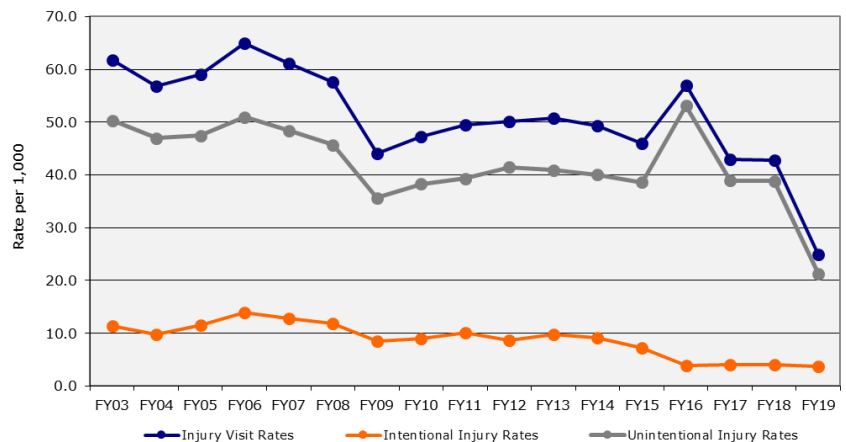

The Clark-Hill Institute for Positive Youth Development regularly examines trends of youth violence in Richmond City. This factsheet examines trends of intentional injury visits at Virginia Commonwealth University Medical Center's Emergency Department (VCU ED) from July 2002 through June 2019 among 10-24 year-old Richmond City residents. The VCU ED is the only level I trauma center in Central Virginia and is estimated to serve approximately three-quarters of Richmond City's trauma patients.

Data were analyzed in fiscal years, starting July 1st and ending June 30th. To determine injury groupings, the CDC-recommended framework for categorizing external cause of injury was used¹. Specifically, data from 2003-2015 were coded using ICD-9 codes. In October 2015, ICD-10 codes were implemented in the VCU Health System, thus the 2016 fiscal year injury groupings were coded using both ICD-9 and ICD-10 codes, and 2017 used ICD-10 codes only. This change may impact how injuries were coded by ED staff and, subsequently, rates by injury groupings may be affected. Caution should be exercised when interpreting changes observed across multiple ICD coding systems. The injury groupings included external injury, assault, abuse, suicide, and firearm injury. A composite variable for intentional injuries was created for this analysis where a visit for assault, abuse, or suicide injuries was defined as an intentional injury. Patients' residential addresses were geocoded using ArcGIS software and examined at the census tract level. Rates for intentional injury visits to the VCU ED were calculated by dividing the number of visits by population estimates derived from the U.S. Census Bureau's American Community Survey 5-year population data.

Rates of Injury Visits

The rate of injury visits to the VCU ED among 10-24 year-olds declined overall between 2003 (61.7 per 1,000) and 2019 (24.9 per 1,000). The trend for the subset of injuries that were unintentional mirrored that of all injury visits while the rate of intentional² injury visits remained relatively stable, with a less pronounced decreasing trend than the overall injury rates during this time period. Intentional injury rates were generally higher in the mid-2000s (i.e., 13.9 per 1,000 in 2006) and were at their lowest between 2016 and 2019 where rates ranged from 3.7 to 4.1 per 1,000. The corresponding numbers and rates per 1,000 for intentional injury and all injury visits are shown in Alternative Table 1 in the Appendix.

Figure 1: Rate of Injury Visits, Ages 10-24 Years, VCU Emergency Department

Demographic Characteristics

Overall, males accounted for two-thirds of intentional injury visits to the VCU ED and, similar to females, were on average 19.3 year of age at the time of their visit (Table 1). Further, rates of intentional injury by sex, race, and ethnicity fluctuated from year to year (Figure 2). Black males had the highest rates of intentional injury visits. While the rate increased generally and peaked in 2011, it then declined through 2016 and subsequently stabilized. Rates among black females had a similar trend pattern compared to their male counterparts. The trend among Hispanic males differed in that the rate decreased in 2011 and 2012, prior to an increase in 2013 and subsequent annual fluctuations. Rates among Hispanic and white females and white males were comparatively low and varied yearly. Additionally, white males, white females, and Hispanic males seen in the ED for intentional injuries tended to be older at 20.8, 20.3 and 20.2 years of age on average during this time period whereas black males, black females, and Hispanic females were comparatively younger overall with mean ages of 19.1, 18.9, and 18.4, respectively (not shown).

¹ ICD Injury Matrices: https://www.cdc.gov/nchs/injury/injury_matrices.htm

² Intentional injuries include visits for assault, firearm, abuse, or attempted suicide

Note: The specific yearly rates for figures can be found in the alternative tables in the appendix.

Trends in Emergency Department Visits for Intentional Injury at Virginia Commonwealth University Medical Center, Ages 10 - 24 Years, 2003-2019

	Number of Injuries (%)			Mean Age	
	Female	Male	Total	Female	Male
FY2003	36.1	63.9	501	18.8	19.0
FY2004	36.1	63.9	424	18.6	18.7
FY2005	32.1	67.9	498	18.7	18.7
FY2006	38.1	61.9	593	18.4*	19.2*
FY2007	40.0	60.0	548	19.2	19.2
FY2008	44.3	55.7	508	18.9*	19.4*
FY2009	39.5	60.5	440	18.8	18.9
FY2010	41.1	58.9	453	19.4	19.4
FY2011	41.1	58.9	509	19.3	19.7
FY2012	42.1	57.9	437	19.6	19.8
FY2013	42.9	57.1	476	19.4	19.7
FY2014	40.2	59.8	393	18.9*	19.9*
FY2015	43.2	56.8	336	19.3	19.7
FY2016	37.5	62.5	176	19.4	19.7
FY2017	42.6	57.4	183	19.5	19.0
FY2018	41.6	58.4	178	19.4	19.8
FY2019	42.1	57.9	164	18.7	18.9

* Denotes statistically significant mean age difference, p-value <= 0.05

Figure 2: Rate of Intentional Injury Visits by Sex, Race, and Ethnicity, Ages 10-24 Years, VCU Emergency Department

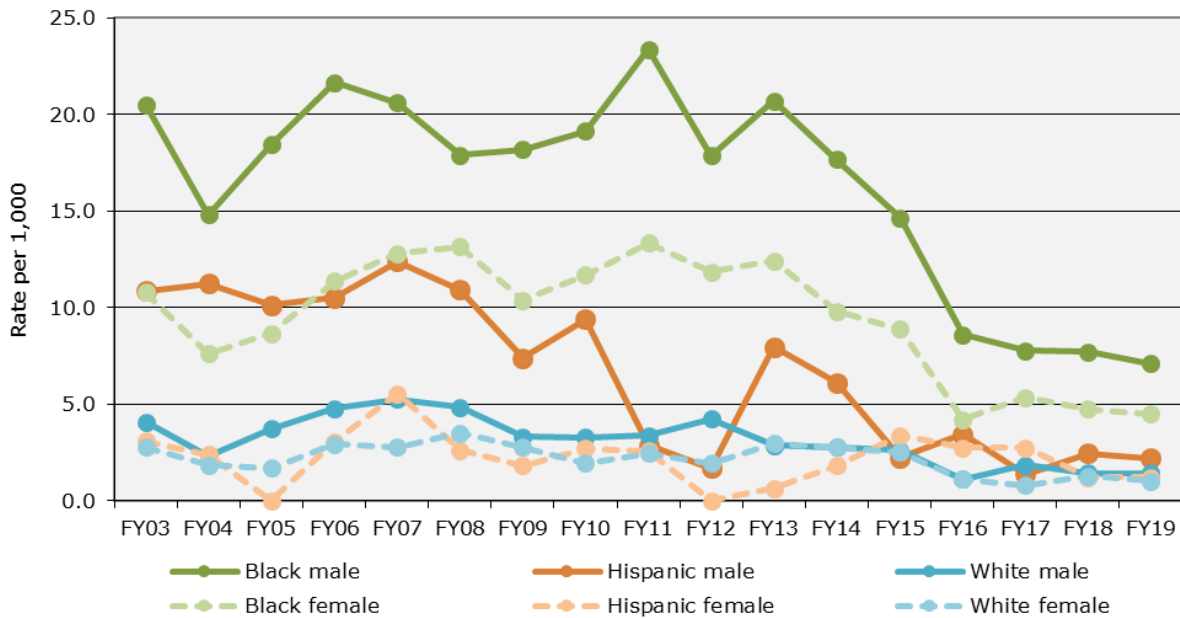

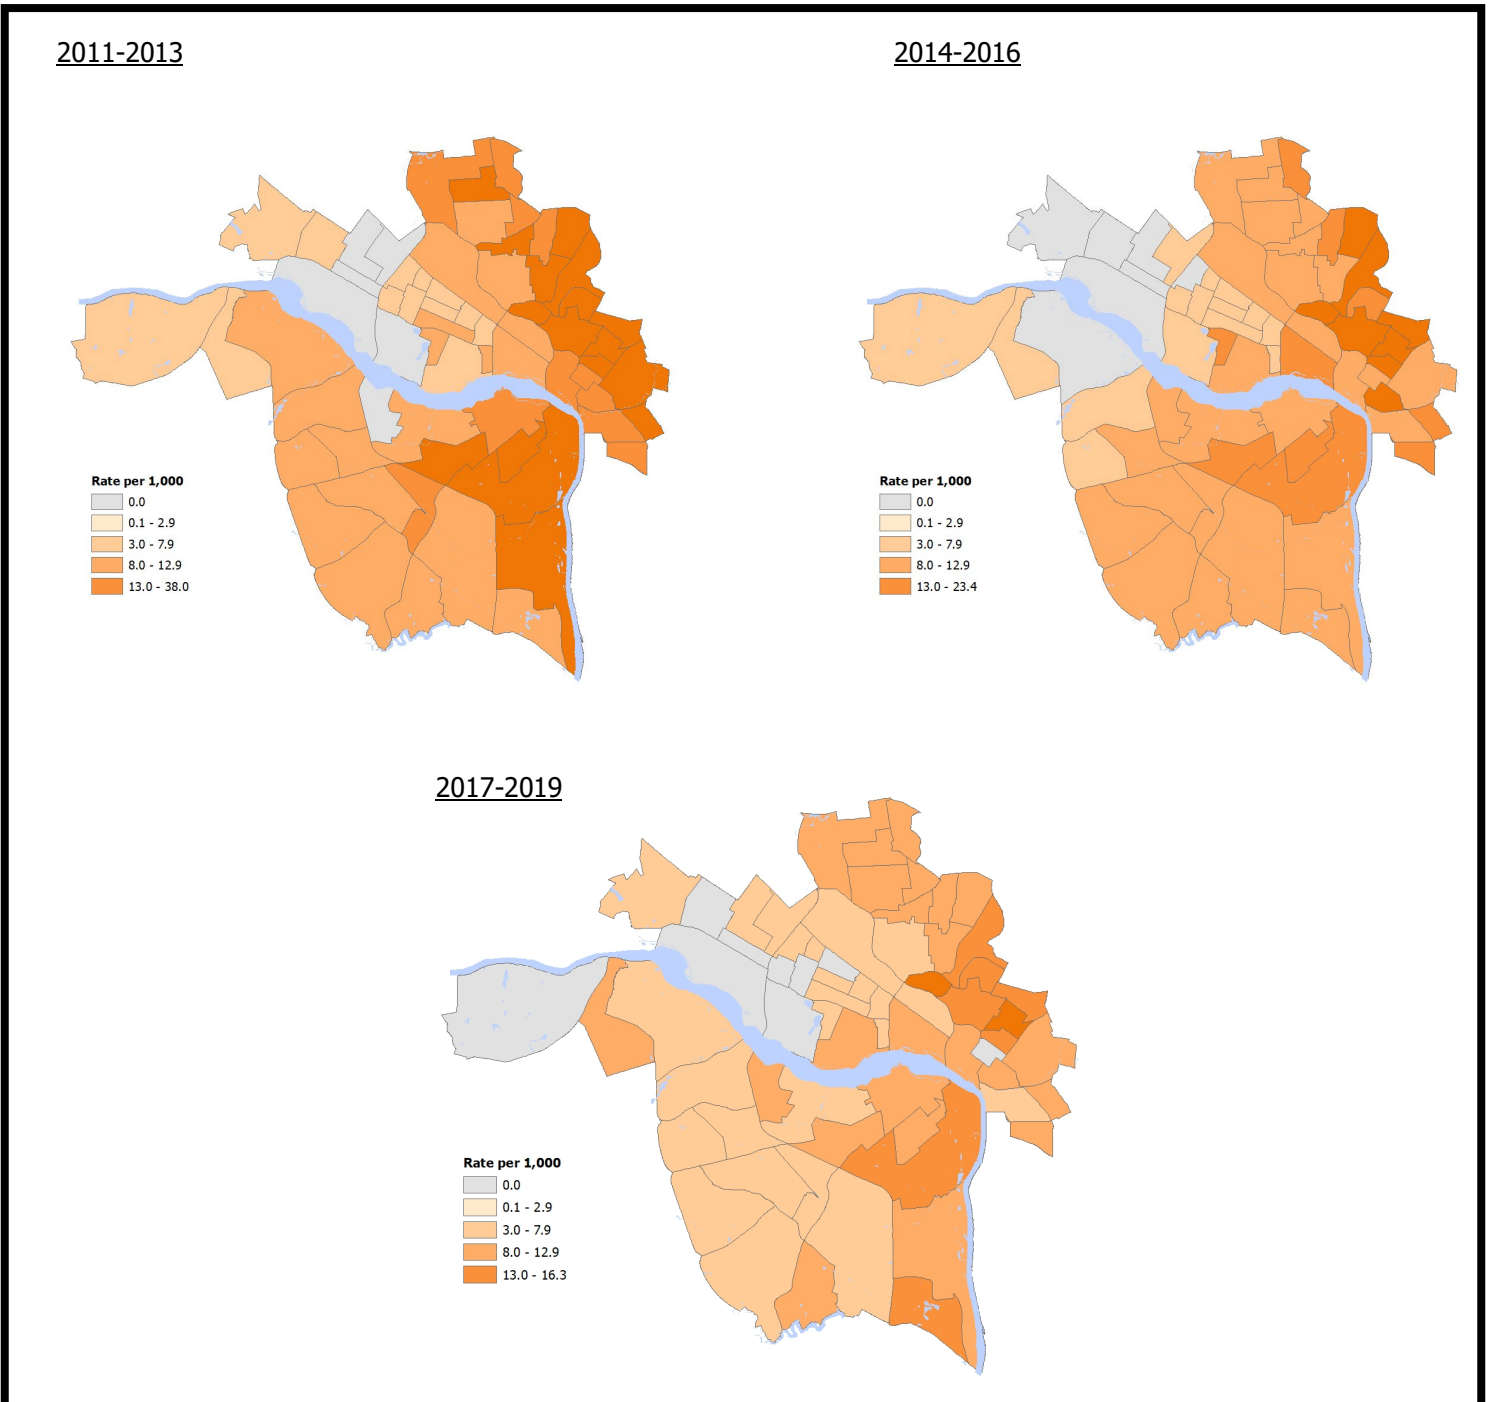

Figure 2 Note: Between FY2003 and FY2010, patient race and ethnicity were not captured independently; however, starting in FY2011, ethnicity was collected separately from race, thus race and ethnicity data from FY2011 forward are not comparable to previous years. The yearly specific rates can be found in Figure 2 Alternative Table in the Appendix.

Trends in Emergency Department Visits for Intentional Injury at Virginia Commonwealth University Medical Center, Ages 10 - 24 Years, 2003-2019

Three-year averaged rates of intentional injury visits among 10-24 year-olds by census tract of residence are shown for 2011 through 2019 in Figure 3. In 2011-2013, the tracts with the highest rates were located in the north and south eastern areas of the city and were more widespread compared to 2014-16 and 2017-2019. In the subsequent 3-year periods, tracts with the highest rates were located only in the northeastern areas and in relatively fewer tracts. Further, rates generally tended to be lower in the western areas of the city.

Figure 3: Intentional Injury Visits by Census Tract of Patient's Residence, Ages 10-24 Years, VCU Emergency Department, 2011-2019

Trends in Emergency Department Visits for Intentional Injury at Virginia Commonwealth University Medical Center, Ages 10 - 24 Years, 2003-2019

Assault-Related Injury Visits

The rate of ED visits due to assault among 10 to 24 year-olds was highest in 2006 at 11.1 per 1,000 and subsequently declined through 2019 to 2.3 per 1,000. The rates of these visits were consistently highest among black individuals and followed the same general pattern as the overall rate but with more pronounced peaks and fluctuations. The rate was lowest among whites and has shown a gradual decline since 2008. The rate among Hispanics differed from the overall rate and the rate among blacks between 2004 and 2007 in that it increased during this time. The rate then declined overall and stabilized to 1.4 per 1000 in 2019, despite increases in some years (Figure 4).

Figure 4: Rate of Assault Visits by Race and Ethnicity, Ages 10-24 Years, VCU Emergency Department

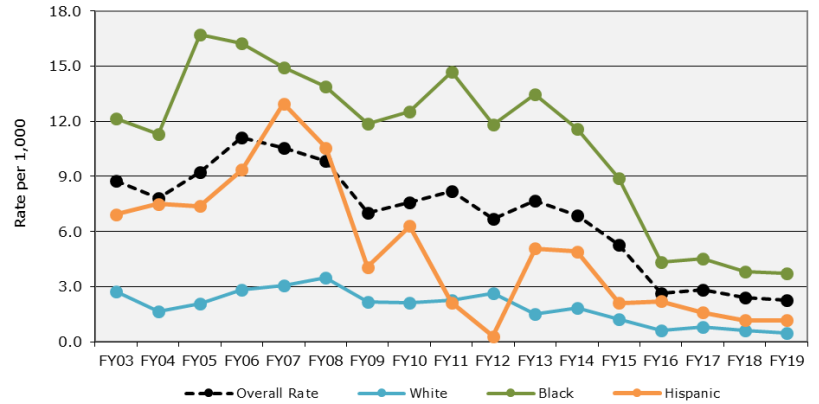

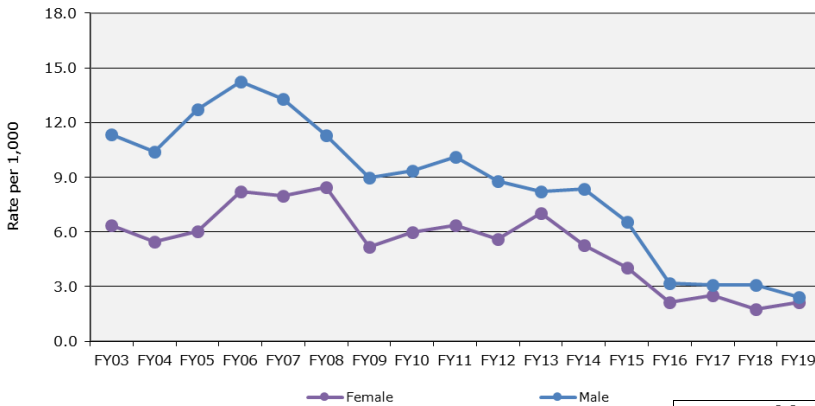

Figure 5: Rate of Assault Visits by Sex, Ages 10-24 Years, VCU Emergency Department

While males comprised 60% of the ED visits for assault injuries overall and their rates were higher compared to females. The difference in the proportion of visits and rates among males and females has decreased over time (Table 2, Figure 5). The rate peaked for males in 2006, whereas the rate for females was highest in 2008 at 14.2 and 8.4 per 1,000, respectively. Then rates for both sexes declined generally to 2019 when rates were at their lowest at 2.4 for males and 2.1 per 1,000 for females (Figure 5). Additionally, the average age for males and females was similar at 19 years overall, however, in 2006 and 2008, there were statistically significant age differences by sex (Table 2).

Table 2: Assault-Related Injury Visits to the VCU Emergency Department by Sex, Ages 10-24 Years, 2003-2019

	Number of Injuries (%)			Mean Age	
	Female	Male	Total	Female	Male
FY2003	37.7	62.3	385	18.9	19.3
FY2004	36.3	63.7	339	18.5	18.7
FY2005	34.2	65.8	398	18.7	18.6
FY2006	38.4	61.6	474	18.4*	19.1*
FY2007	39.2	60.8	451	19.4	19.3
FY2008	44.5	55.5	422	18.8*	19.4*
FY2009	38.8	61.2	363	19.0	19.0
FY2010	41.6	58.4	380	19.3	19.3
FY2011	41.0	59.0	410	19.4	19.9
FY2012	42.0	58.0	355	19.8	19.8

Trends in Emergency Department Visits for Intentional Injury at Virginia Commonwealth University Medical Center, Ages 10 - 24 Years, 2003-2019

The majority of firearms-related injury visits were by males. While their rates initially increased and peaked in 2006 at 6.2 per 1,000, this was followed by an overall decline through 2019 to 2.1 per 1,000. Firearm-related injury visits for females were generally consistent and below 1.0 per 1,000 during this time period (Figure 6). The mean age of males and females seen in the ED for firearms-related injuries were similar overall and ranged from 18 to 21 years, however males tended to be slightly older in general (Table 3).

Figure 6: Rate of Firearm-Related Visits by Sex, Ages 10-24 Years, VCU Emergency Department

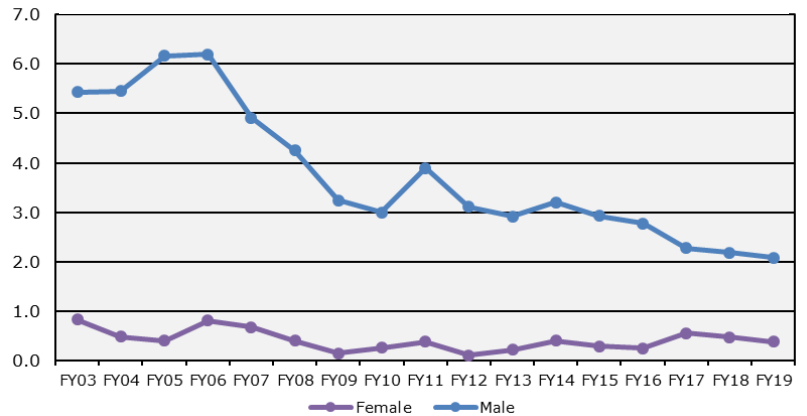

Table 3: Firearm-Related Injury Visits to the VCU Emergency Department by Sex, Ages 10-24 Years, 2003-2019

	Number of Visits (%)			Mean Age	
	Female	Male	Total	Female	Male
FY2003	14.2	85.8	134	18.9	18.8
FY2004	8.9	91.1	124	19.4	20.2
FY2005	6.6	93.4	136	18.9	19.1

**Trends in Emergency Department Visits for Intentional Injury at
Virginia Commonwealth University Medical Center, Ages 10 - 24 Years, 2003-2019**

The overall rate of suicide-related injury visits was generally stable between 2005 and 2016, with rates between 1.0 and 1.4 per 1,000 for these combined 3-year periods; however, the rate decreased in 2017-2019 to 0.3 per 1,000. Rates were consistently higher among females compared to their male counterparts, except for in 2017-2019, where rates were the same by sex (Figure 7). Further, compared to males, females tended to be younger when they visited the VCU ED for suicide-related injuries and in 2014 and 2018, this difference was statistically significant (Table 4).
